**Charles Sutherland : GMO Food Poison Handbook: 'Genetically-Modified' Agriculture and Animals** before purchasing it in order to gage whether or not it would be worth my time, and all praised GMO Food Poison Handbook: 'Genetically-Modified' Agriculture and Animals:

11 of 12 people found the following review helpful. Get out of your comfort zone and educate yourself about the

actual and potential dangers of GMO's. By John L Bauserman, Jr This is an important book. It is not a comforting read. This is not about the gradual natural, 'Mendelian' genetic selection practiced in agriculture by our great grandparents and their forerunners in many civilizations around the World for millennia. The subject goes to the very foundation of the lucrative and increasingly common practice of development, production and use of genetically modified plants and animals, which form a ever-widening foundation of big agricultural and animal husbandry companies. The author, Charles Sutherland, does a great service to us all by systemically and logically reviewing the myriad of serious health implications of GMO products for our people and planet in ways both large and small. The author has a bias to be sure, but it is an informed and educated bias: he is uncompromising in his advocacy for healthy food products for consumption by people and in expressing his concern for the serious potential risks and hazards to the environment occasioned by use genetically modified plants and animals. This book too is a jeremiad, but one which cannot be dismissed. Mr. Sutherland has painstakingly collected and summarized world class research from inside and outside of the United States. His compendium reminds us that many ethical and brilliant persons around the world have serious, scientifically well founded concerns and reservations about the real and potential inherent dangers to human health and to the environment from the proliferation of genetically modified plants and animals. After reading large portions of this valuable reference, I disagree somewhat with the author, but only to the extent that I would conclude that there is not a substantive body of scientific literature - yet - which clearly demonstrates concrete causal links between actual, direct harms to human health and GMO's. But while there is not a substantive body of research in regard to actual harms to human health in my judgment, there is a substantive body of research which the author presents, which gives one great cause to be concerned about the potential risks and harms to human health associated from proliferation of GMO crops and animals. Indeed, as Mr. Sutherland points out, the environmental harms directly related to increasing use of GMOs are already manifesting in ways large and small that are bad for our environment, bad for animals and overall toxic for the environment (with ominous negative implications for human health!). One need read no further than the portions of the GMO Food Poison Handbook dealing with the deleterious environmental effects of the chemical "glyphosate," which is used in increasingly heavy concentrations sprayed on crops genetically modified to survive the herbicide "Roundup." Even incredibly miniscule trace amounts of this chemical have been shown to have negative effects on animals in studies, with the implications for human health being frightening (but uncertain only in just how bad it will prove to be). Then there is the manifestation of increasingly pesticide resistant insects and herbicide resistant weeds, with ominous implications for farmers and with demonstrated harm to the environment... well, read this book and you will understand better. I am now convinced by Charles Sutherland that the case is well made and the evidence is in for a moratorium on GMO's; and for honest, government mandated labeling; and for systemic, publicly funded studies of a broad and longitudinal nature to better understand the actual and potential harms and risks to our food supply and environment. Public awareness is the only avenue that seems successful in slowing down the proliferation of GMO'. We can no longer afford to ignore the real and potential consequences of the effect these decisions have on us now and twenty years from now. This a great reference tool and informative. I almost wish I hadn't read it, but the evidence presented and questions raised can't be ignored. 6 of 7 people found the following review helpful. GMO Poison Handbook... Great resource, and extremely eye opening. By Kristian Watkins The GMO Poison Handbook is extremely informative and well cited. As a reference, it is very approachable. Sutherland sheds light on the revolving door between the government (... "for the people" ...) and companies like Monsanto willing to poison, for profit. These well documented studies and sources demonstrate unequivocally, that GMO food is quietly under nourishing the population, and even causing permanent irreparable harm to its consumers. It is truly scary. We don't know the extent to which the food supply has become tainted. We don't when we are eating what agro lobbied to be called a food equivalent. We don't know the full extent to which these these creations cause harm to people and animals alike, and what we do know is damning! Finally it is prophetically misguided to allow someone to own patents to building blocks of life. 1 of 1 people found the following review helpful. Documents in chapter after chapter the ruinous effects of GMOs ... By Sam Clifford Documents in chapter after chapter the ruinous effects of GMOs on every living thing and on all the systems of all organisms.

"GMO crops are scientifically created to BE poisonous and to ABSORB poison." The American chemical industry, having taken control of agriculture, has achieved something never before accomplished in the history of mankind: humans who are simultaneously overfed and undernourished...and poisoned." The GMO Food Poison Handbook is a summary of GMOs (genetically modified organisms), 'food products' created by Monsanto and other chemical companies. In simple terms it describes how the various GMO food products create biological and medical problems, including birth defects, cancer, and diabetes. To better inform the reader, the Handbook provides simple descriptions of 20 body organs which are affected, as well as the nature of allergies, obesity, and cancer and the male and female reproductive organs, including the fetus in the womb. As an interesting part of the description, the function of each body part is explained - so the Handbook is also a 'Biology for Beginners' in clearly explaining basic biology with illustrations. Most disturbing are the results of studies which reveal that these GMO food toxins remain inside of our intestines and continuously reproduce! The reader will also learn how the GMO crops poison the worlds soil, water,

and air, and destroy the natural habitat of bacteria, bees, and fish. A ready reference book, the *GMO Food Poison Handbook* provides a clear summary of studies from renowned research scientists in thirty (30) countries (with links to those studies for those who wish to see them in depth), and comments from journalists around the world. If you eat, you will want to read this book!

**About the Author** Charles Sutherland was educated at schools and universities in the United States and Europe, including the University of Vienna and the London School of Economics and Political Science. He has been an international businessman for over 30 years, with travel to over 60 countries. He has launched a variety of corporations and philanthropic organizations in the United States, Europe (including the Soviet Union), and the Middle East. He has also been Director of Development of *The Washington Times*, and author of numerous articles and several books, including *Disciples of Destruction: The Religious Origins of War and Terrorism*; *Character for Champions*; *Red Tape: Adventure Capitalism in the New Russia* (co-author); *Clash of the Gods* (co-author); and *The Poison Planters*. He has two sons and lives in the Washington, DC area.
